Relación entre la frecuencia del síntoma con la exposición de campo eléctrico

CONCLUSIONES

Estos resultados coinciden con estudios similares [Santini 2002, Hutter 2002]

Basados en este estudio y en línea con la evidencia empírica de los últimos años el Departamento de Salud Pública de Salzburgo recomendó no sobrepasar nunca un promedio residencial de 0,0001 uW / cm² para las estaciones GSM de Telefonía Móvil

De esta forma el presente estudio realizado en la población española de La Ñora, Murcia ha servido de manera clave para establecer la anterior propuesta por el departamento de Salud Pública de Salzburgo desde el 2002
